

PAUSE function on Delta, Brizo and Peerless showerheads and hand showers

The pause setting function on Delta, Brizo and Peerless showerheads and hand showers gives you ample space for shaving, lathering and other shower tasks, then easily restarts the water with the temperature where you left off. This spray setting helps you conserve water, so you can worry less about depleting your supply of hot water - and you help the environment too.

This pause function is NOT a 100% shutoff. Pause function is a slow drizzle that lessens the water output, not complete off.

If you get a call from a customer saying their showerhead or hand shower has a defective function, chances are they are thinking their pause feature is a defect.....rest assured it is not! This feature is purposely a slow trickle, allowing you to perform other showering tasks without turning off the water completely.

When selling these products with this pause feature, explain the wonderful benefits of pause so they can fully appreciate and understand this helpful feature.
